In detail, the Hypo-RESOLVE consortium will address the following challenges

Establish a dialogue with regulators and other stakeholder about hypoglycaemia in general and more specifically the learnings from the Hypo-RESOLVE project in order to develop a consensus on definitions and data collection methods for the standardisation of clinical investigations with regard to hypoglycaemia

Undertake health economic analyses which extend beyond severe hypoglycaemia and will measure the economic impact of hypoglycaemic episodes

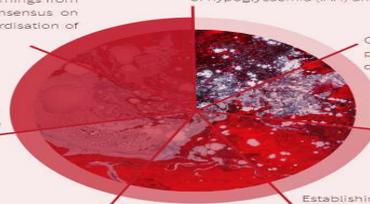

Determine the psychological impact of hypoglycaemia in people with diabetes and family members, and develop patient related outcome (PRO) measures, which reliably assess the psychological impact of hypoglycaemia and can be included as standard outcome measures in future clinical trials, both commercial and academic

Conducting integrated non-clinical and translational studies to identify underlying molecular mechanisms, consequences and biomarkers of impaired awareness of hypoglycaemia (IAH) and (recurrent) hypoglycaemia.

Combining large datasets obtained from various pharmaceutical/technology companies using different methods of data capture

Conducting extensive statistical analyses in large data sets to confirm existing predictors and consequences of hypoglycaemia and identify new associations

Establishing how the vast potential of continuous glucose monitoring (CGM) systems as clinical and research tools, can be used in clinical practice and incorporated successfully in future clinical trials

INNODIA and INNODIA HARVEST: Public Private Partnerships for T1D in Europe

iNNODIA

iNNODIA HARVEST

www.INNODIA.eu

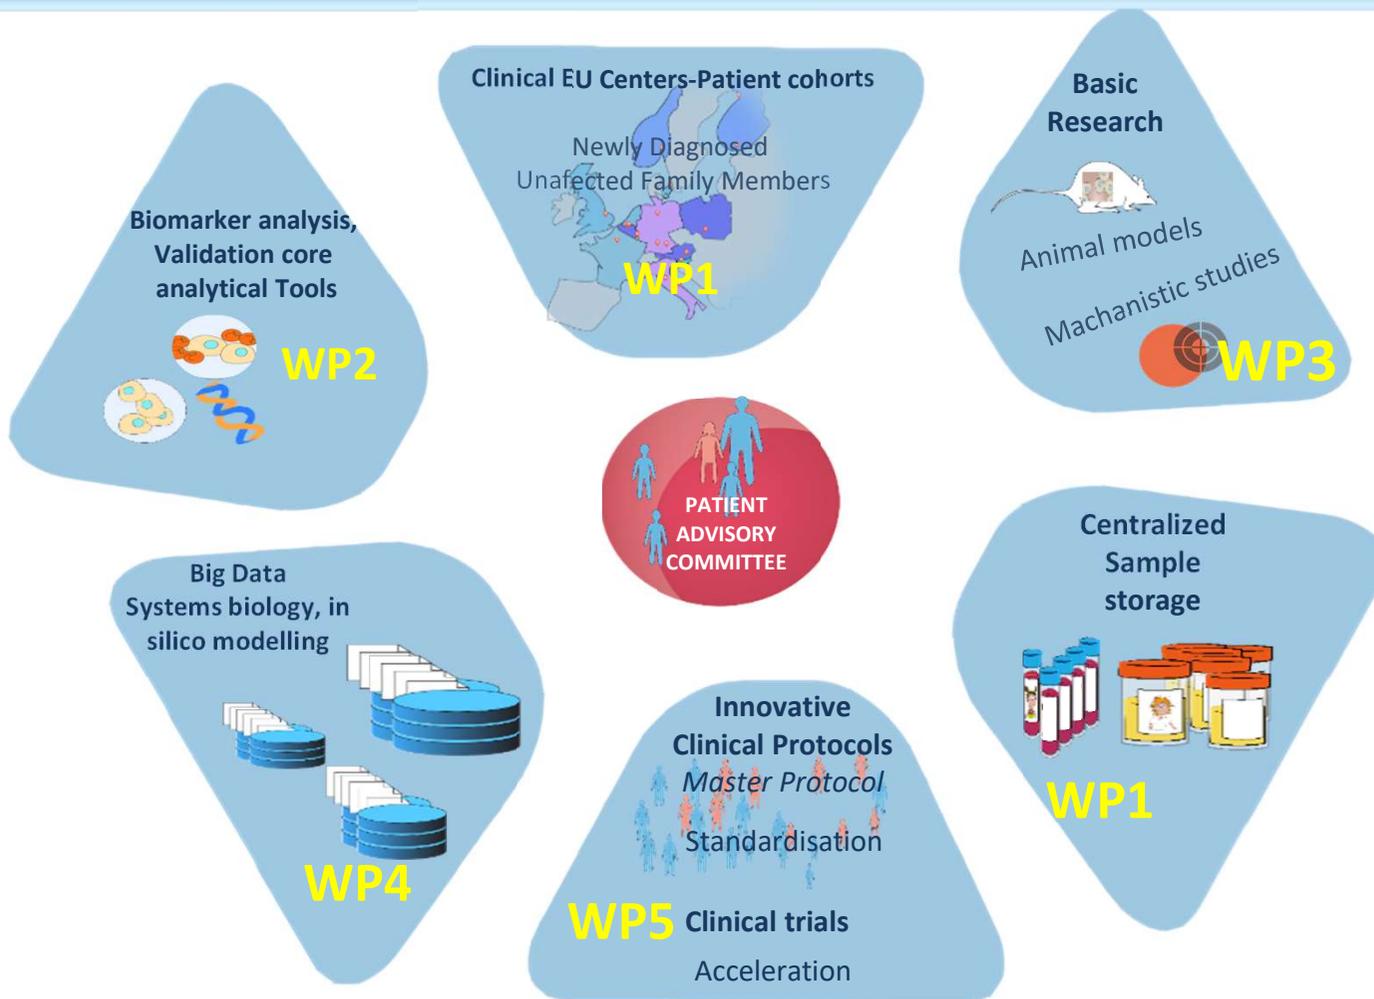

Objectives of INNODIA

1. To develop an **EU infrastructure** for the recruitment, detailed clinical phenotyping and bio-sampling of a large cohort of newly diagnosed subjects with T1D and at risk family members, generating an **unrivalled bioresource of T1D discovery science**.
2. To establish a tight **collaborative network of basic and clinical researchers** working in a coordinated and focused way to address key knowledge gaps in relation to b-cell autoimmunity, leading to a better understanding of the pathogenesis of T1D and a cure for this disease. Research will focus on the question why the immune system loses tolerance towards the b-cell, the dialogue between b-cells and the immune system and which b-cell pathways contribute to its dysfunction and death in T1D.
3. To advance the **development and application of novel methodologies** by exploiting our major strengths in bioresource and 'omics' technologies.
4. To establish a **unique integrated database** assimilating historical data, with data from clinical and experimental sources. This will permit bioinformatics-assisted visualization and modelling of interactions between phenotype, genetic, immune and metabolic pathways to explore subtypes, potentially redefining ontogeny of T1D in the context of prevention and intervention strategies.
5. To conceive **innovative clinical trial designs** that exploit novel validated biomarkers allowing better subject stratification and functioning as surrogate endpoints, thus yielding shorter and more focused intervention studies of single or combined therapies.

1. **WE HAVE developed** an **EU infrastructure** for the recruitment, detailed clinical phenotyping and bio-sampling of a large cohort of newly diagnosed subjects with T1D and at risk family members. **WE HAVE generated** an **unrivalled bioresource of T1D discovery science**.
2. **We HAVE established** a tight **collaborative network of basic and clinical researchers** working in a coordinated and focused way to address key knowledge gaps in relation to b-cell autoimmunity, leading to a better understanding of the pathogenesis of T1D and a cure for this disease. Research will focus on the question why the immune system loses tolerance towards the b-cell, the dialogue between b-cells and the immune system and which b-cell pathways contribute to its dysfunction and death in T1D.
3. **We ARE advancing** the **development and application of novel methodologies** by exploiting our major strengths in bioresource and 'omics' technologies.
4. **We HAVE established** a **unique integrated database** assimilating historical data, with data from clinical and experimental sources. This **permits** bioinformatics-assisted visualization and modelling of interactions between phenotype, genetic, immune and metabolic pathways to explore subtypes, **potentially** redefining ontogeny of T1D in the context of prevention and intervention strategies.
5. **We HAVE conceived** **innovative clinical trial designs** that exploit novel validated biomarkers allowing better subject stratification and functioning as surrogate endpoints, thus yielding shorter and more focused intervention studies of single or combined therapies.

Translational approaches to disease modifying therapy of type 1 diabetes: an innovative approach towards understanding and arresting type 1 diabetes.

[Sign In](#)

Overview

Our Type 1 diabetes (T1D) is a life-threatening, autoimmune chronic disease present at any age. Typically presents in early life with a peak around puberty. It affects around 17 million people in Europe and there is no way to prevent it, and at present, no cure. Every hour, 24h a day, 365 days a year we, the members of the Patient Advisory Committee, live with this disease, with hypo and hyperglycemia fear. Just like you.

[View details »](#)

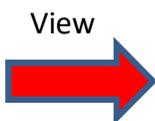

Overall objective

The overall objective of INNODIA therefore is to advance in a decisive way how we predict, evaluate and prevent the onset and progression of type 1 diabetes (T1D), by creating novel tools, such as biomarkers, disease models and clinical trial paradigms. These tools will allow to distinguish and understand at the cellular and molecular level distinctive paths of ontogeny and progression in this heterogeneous disease, thus impacting on the future management of T1D patients and at risk individuals. For this goal, INNODIA will establish a comprehensive and interdisciplinary network of clinical and basic scientists, who are leading experts in the field of T1D research in Europe, with complementary expertise from the areas of immunology, beta-cell biology and biomarker research. The consortium will interact in a coordinated fashion with all major stakeholders in the process, in particular regulatory bodies and patients with T1D and their families.

INNODIA/INNODIA HARVEST: IMI-2 projects

INNODIA

Thank you for your attention

INNODIA is a unique and interdisciplinary network of 40 partners, including preeminent academic institutions from Europe, industrial partners, charitable foundations and small sized enterprises and a dedicated group of advising patients, bringing together their knowledge and experience to achieve one common goal: "To fight type 1 diabetes". Launched in January 2016, this European-based public private partnership (PPP) receives funding from the Innovative Medicines Initiative 2 Joint Undertaking (Grant Agreement Number: 115797) and is supported by the European Union's Horizon 2020 Research and Innovation program, European Federation of Pharmaceutical Industries and Associations (EFPIA), The Leona M. and Harry B. Helmsley Charitable Trust and JDRF. INNODIA HARVEST (Grant Agreement Number: 945268) an extension of INNODIA, enables to run more clinical trials on the backbone of the INNODIA clinical network.
